Demo & Final Code Due date

: June 07, 2019

Workshop 3

Notes:

- **i.** Each task should be presented during the lab, demo worth 70% of the workshop marks and code uploading worth the other 30%.
- ii. Make sure you have all security and check measures in place, like wrong data types etc., Handle the security checks using the proper exceptional handling techniques.
- **iii.** Given output structure is just for student to have a glimpse what the output can look, student are free to make the output better in any way.
- iv. The final should be submitted by the midnight to avoid late penalties which are 10% each day late.

Other inputs can be given during demo, so make sure you test your program properly.

Task 1: A complex number is a number in the form a + bi, where a and b are real numbers and b is 2-1. The numbers a and b are known as the real part and imaginary part of the complex number, respectively. You can perform addition, subtraction, multiplication, and division for complex numbers using the following formulas:

$$a + bi + c + di = (a + c) + (b + d)i$$

$$a + bi - (c + di) = (a - c) + (b - d)i$$

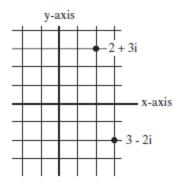

$$(a + bi) * (c + di) = (ac - bd) + (bc + ad)i$$

$$(a + bi)/(c + di) = (ac + bd)/(c^2 + d^2) + (bc - ad)i/(c^2 + d^2)$$

You can also obtain the absolute value for a complex number using the following formula:

$$|a+bi|=\sqrt{a^2+b^2}$$

(A complex number can be interpreted as a point on a plane by identifying the (a,b) values as the coordinates of the point. The absolute value of the complex number corresponds to the distance of the point to the origin, as shown in Figure)

- Design a class named Complex for representing complex numbers.
- The methods
 - o add,
 - o subtract,
 - o multiply,
 - o divide, and
 - o abs

for performing complexnumber operations.

- Override toString method for returning a string representation for a complex number.
 (The toString method returns (a + bi) as a string. If b is 0, it simply returns a.)
- Your Complex class should also implement the Cloneable interface.

Provide three constructors

- o Complex(a, b),
- o Complex(a), and
- o Complex().

Complex() creates a Complex object for number 0 and Complex(a) creates a Complex object with 0 for b. Also provide the getRealPart() and getImaginaryPart() methods for returning the real and imaginary part of the complex number, respectively.

Write a test program that prompts the user to enter two complex numbers and displays the result of their addition, subtraction, multiplication, division, and absolute value. Here is a sample run:

```
Enter the first complex number: 3.5 	ext{ 5.5} Lenter

Enter the second complex number: -3.5 	ext{ 1} Lenter

(3.5 + 5.5i) + (-3.5 + 1.0i) = 0.0 + 6.5i

(3.5 + 5.5i) - (-3.5 + 1.0i) = 7.0 + 4.5i

(3.5 + 5.5i) * (-3.5 + 1.0i) = -17.75 + -13.75i

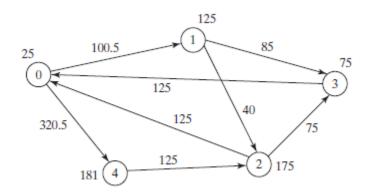

(3.5 + 5.5i) / (-3.5 + 1.0i) = -0.5094 + -1.7i

|(3.5 + 5.5i)| = 6.519202405202649
```

Task 2:

JAC – 444 Summer 2019 Section --- SAB

Banks lend money to each other. In tough economic times, if a bank goes bankrupt, it may not be able to pay back the loan. A bank's total assets are its current balance plus its loans to other banks. The diagram below shows five banks. The banks' current balances are 25, 125, 175, 75, and 181 million dollars, respectively. The directed edge from node 1 to node 2 indicates that bank 1 lends 40 million dollars to bank 2.

Banks lend money to each other

If a bank's total assets are under a certain limit, the bank is unsafe. The money it borrowed cannot be returned to the lender, and the lender cannot count the loan in its total assets. Consequently, the lender may also be unsafe, if its total assets are under the limit.

Write a program to find all the unsafe banks. Your program reads the input as follows.

- 1. It first reads two integers n and limit, where n indicates the number of banks and limit is the minimum total assets for keeping a bank safe from the user.
- 2. It then reads n lines that describe the information for n banks with IDs from 0 to n-1.

The first number in the line is the bank's balance, the second number indicates the number of banks that borrowed money from the bank, and the rest are pairs of two numbers. Each pair describes a borrower. The first number in the pair is the borrower's ID and the second is the amount borrowed.

For example, the input for the five banks in above picture is as follows (**note that the limit is 201**):

Number of banks: 5

Minimum asset limit: 201

Bank # 0 \rightarrow Balance: 25 \rightarrow Number of banks Loaned: 2 \rightarrow Bank ID: 1 \rightarrow Amount: 100.5 \rightarrow

Bank ID: $4 \rightarrow$ Amount: 320.5

Bank # 1 \rightarrow Balance: 125 \rightarrow Number of banks Loaned: 2 \rightarrow Bank ID: 2 \rightarrow Amount: 40 \rightarrow

Bank ID: 3 → Amount: 85

Bank # 2 \rightarrow Balance: 175 \rightarrow Number of banks Loaned: 2 \rightarrow Bank ID: 0 \rightarrow Amount: 125 \rightarrow

Bank ID: 3 → Amount: 75

Bank # 3 \rightarrow Balance: 75 \rightarrow Number of banks Loaned: 1 \rightarrow Bank ID: 0 \rightarrow Amount: 125

JAC – 444 Summer 2019 Section --- SAB

Bank # 4 → Balance: 181 → Number of banks Loaned: 1 → Bank ID: 2 → Amount: 125

The total assets of bank 3 are (75 + 125), which is under 201, so bank 3 is unsafe. After bank 3 becomes unsafe, the total assets of bank 1 fall below (125 + 40). Thus, bank 1 is also unsafe.

Note: Program should take inputs from the user like Number of banks, Minimum asset limit and then all other inputs

The output of the program should be Unsafe banks are 3 and Bank 1
